Since the first edition in 1948, Patty's Industrial Hygiene and Toxicology has become a flagship publication for Wiley. In the course of its nearly six decades in print, it has evolved into a standard reference for the fields of occupational health and toxicology. The volumes on Industrial Hygiene are cornerstone reference works for chemists, engineers, toxicologists, and occupational safety personnel. Since the 5th edition was published, the field of IH has changed with personnel often working for multinational firms, self-employed, at small consulting firms. Their environment has changed and expanded, and thus also the types of information and resources required have changed. The traditional areas of interest to occupational health and safety professionals include anticipation, recognition, evaluation and control of potential hazards. In addition to these, the 6th edition provides information and reliable resources to prepare for natural disasters, exposures to biological agents and potential acts of terrorism.

Modern science is ever more driven by computations and simulations. In particular, the state of the art in space and Earth science often arises from complex simulations of climate, space weather, and astronomical phenomena. At the same time, scientific work requires data processing, presentation, and analysis through broadly available proprietary and community software.1 Implicitly or explicitly, software is central to science. Scientific discovery, understanding, validation, and interpretation are all enhanced by access to the source code of the software used by scientists. This report investigates and recommends options for NASA's Science Mission Directorate (SMD) as it considers how to establish a policy regarding open source software to complement its existing policy on open data. In particular, the report reviews existing data and software policies and the lessons learned from the implementation of those policies, summarizes community perspectives, and presents policy options and recommendations for implementing an open source software policy for NASA SMD.

Although half of all deafness and hearing impairment is avoidable, an estimated 278 million people worldwide are living with disabling hearing impairment (moderate or worse level of hearing loss in the better hearing ear). Many more have mild hearing loss and/or ear diseases. One quarter of hearing impairment begins during childhood, and 80% of all deaf and hearing impaired people live in low and middle income countries. These problems can be life-long and sometimes life-threatening; they may have profound effects on: inter-personal communication, education, employment prospects, social relationships and through stigmatization. They produce substantial economic burdens on countries. Some of the most effective and cost-effective interventions against ear and hearing problems can be implemented at the primary level by trained primary ear and hearing care (PEHC) workers or primary health care (PHC) workers or their equivalents. Used on a large scale, these interventions will have a major impact on the burden of ear disease and hearing loss. However most developing countries do not have PEHC workers and the topic is hardly addressed in the training of PHC workers. The Primary Ear and Hearing Care Training Resource manuals provide practical information and guidance and can be used as part of a training course, stand-alone training module or in a self-taught manner. They are designed to be useful to a wide range of primary health care personnel. The manuals can also be used to help communities understand common causes of deafness and hearing impairment and ways to prevent and/or treat the conditions.

This book covers the design, implementation, and auditing of structured occupational health and safety management systems (SMS), sometimes referred to as safety programs. Every workplace has a form of SMS in place as required by safety regulations and laws. The Design, Implementation, and Audit of Occupational Health and Safety Management Systems describes some of the elements that constitute an SMS, the implementation process, and the auditing of the conformance to standards. It covers more than 60 processes, programs, or standards of a system, and gives important background information on each element. Guidelines and examples show how to design and implement the risk-based processes, programs and standards, and how to audit them against standards. The text is based on actual SMS implementation experiences across a wide range of industries. It offers a roadmap to any organization which has no structured SMS. It will guide them through the process of upgrading their health and safety processes to conform to local and international standards. It will lead them away from relying on reactive safety measures such as injury rates, to proactive actions which are measured by the audit of the system. Features Covers more than 60 elements of a safety management system (SMS) Provides practical examples of how to design, implement, and audit a structured SMS Based on actual SMS implementation experience across a wide range of industries Presents the integration of an SMS into the day-to-day functions of the organization
