Spring Semester, 2001. Course Title: Topics in Algebra, Equations over finite fields. Brief description: We will study the classical topic of counting or estimating the number of solutions to (systems of) polynomial equations over finite fields. We will first review the basic theory of finite fields and study some elementary and combinatorial bounds, such as the Chevalley-Warning theorem and generalizations.

In fact, given any prime p and an integer $r \geq 1$, there is one and only one field F_q of $q = p^r$ elements. The field $F_q \cong F_p$ and for each α in F_q , $p \alpha = 0$. Conversely, any finite field is F_q , for some $q = p^r$ (cf. Ref. 18). The field F_q is characterized by the property. $f(X) = X^q - X = \prod_{\alpha \in F_q} (X - \alpha)$.

In mathematics, an elliptic curve is a smooth, projective, algebraic curve of genus one, on which there is a specified point O . Every elliptic curve over a field of characteristic different from 2 and 3 can be described as a plane algebraic curve given by an equation of the form $y^2 = x^3 + ax + b$. $\{\displaystyle y^2=x^3+ax+b.\}$ The curve is required to be non-singular, which means that the curve has no cusps or self-intersections. It is always understood that the curve is really

NUMBERS OF SOLUTIONS OF EQUATIONS IN FINITE FIELDS ANDRÉ WEIL The equations to be considered here are those of the type $(1) a_0x^n + a_1x^{n-1} + \dots + a_r x^r = b$. Such equations have an interesting history. In art. 358 of the Disquisitiones [1, a], Gauss determines the Gaussian sums (the so-called cyclotomic "periods") of order 3,

Numbers of Solutions of Equations in Finite Fields

A system of polynomial equations (sometimes simply a polynomial system) is a set of simultaneous equations $f_1 = 0, \dots, f_h = 0$ where the f_i are polynomials in several variables, say x_1, \dots, x_n , over some field k .

one might want to take a finite field instead of \mathbb{Q} and consider solutions to an equation such as (1'), where x and y are numbers in this other field. Let me start by recalling the basic facts about finite fields. Let p be a prime number.

Why Study Equations over Finite Fields?

We use character sums over finite fields to give formulas for the number of solutions of certain diagonal equations of the form $a_1 x_1^{m_1} + a_2 x_2^{m_2} + \dots + a_n x_n^{m_n} = c$. We also show that if the value distribution of character sums $\sum_{x \in \mathbb{F}_q} \chi(a x^m + b x)$, $a, b \in \mathbb{F}_q$, is known, then one can obtain the number of solutions of the system of equations $\{x_1^m + x_2^m + \dots + x_n^m = \sum_{i=1}^n x_i^{m_i} = \dots\}$, for some particular m .

Lacunary Polynomials Over Finite Fields focuses on reducible lacunary polynomials over finite fields, as well as stem polynomials, differential equations, and gaussian sums. The monograph first tackles preliminaries and formulation of Problems I, II, and III, including some basic concepts and notations, invariants of polynomials, stem polynomials, fully reducible polynomials, and polynomials with a restricted range. The text then takes a look at Problem I and reduction of Problem II to Problem III. Topics include reduction of the marginal case of Problem II to that of Problem III, proposition on power series, proposition on polynomials, and preliminary remarks on polynomial and differential equations. The

publication ponders on Problem III and applications. Topics include homogeneous elementary symmetric systems of equations in finite fields; divisibility maximum properties of the gaussian sums and related questions; common representative systems of a finite abelian group with respect to given subgroups; and difference quotient of functions in finite fields. The monograph also reviews certain families of linear mappings in finite fields, appendix on the degenerate solutions of Problem II, a lemma on the greatest common divisor of polynomials with common gap, and two group-theoretical propositions. The text is a dependable reference for mathematicians and researchers interested in the study of reducible lacunary polynomials over finite fields.
