Quantum technologies are set to revolutionise society in many ways: from creating new types of computers to solve very difficult problems, very quickly, to making uncrackable communications systems and sensors that operate beyond conventional limits. The University of Bristol has been pioneering in this worldwide effort for more than 15 years with an approach that uses light and optoelectronic ...

This textbook equips students interested in becoming researchers with the essential nontechnical skills. After an introduction to graduate schools, it discusses preparing for research, reading and organizing literature, writing research articles and other documents, publishing papers, presenting research findings at conferences, collaboration with advisors and other researchers, patent applications, research ethics, and how to improve research by learning about the history of science. These nontechnical skills are just as important as technical ones in terms of becoming a successful graduate student, yet they have seldom been taught systematically in courses. Further, they can bridge the gap from the classroom to the lab, making one of the most critical transition periods from student to researcher smoother and more enjoyable. The book features a wealth of real-life examples and exercises, which readers can easily apply in their own research. Intended mainly for graduate and upper-undergraduate students just embarking on lab research, it can also be used as a textbook or reference guide for courses on research methodology and related topics.

The student supplement to the successful textbook describing the full range of the astronomical universe.

Praise for the First Edition "Now a new laboratory bible for optics researchers has joined the list: it is Phil Hobbs's Building Electro-Optical Systems: Making It All Work." **Tony Siegman, Optics & Photonics News** Building a modern electro-optical instrument may be the most interdisciplinary job in all of engineering. Be it a DVD player or a laboratory one-off, it involves physics, electrical engineering, optical engineering, and computer science interacting in complex ways. This book will help all kinds of technical people sort through the complexity and build electro-optical systems that just work, with maximum insight and minimum trial and error. Written in an engaging and conversational style, this Second Edition has been updated and expanded over the previous edition to reflect technical advances and a great many conversations with working designers. Key features of this new edition include: Expanded coverage of detectors, lasers, photon budgets, signal processing scheme planning, and front ends Coverage of everything from basic theory and measurement principles to design debugging and integration of optical and electronic systems Supplementary material is available on an ftp site, including an additional chapter on thermal Control and Chapter problems highly relevant to real-world design Extensive coverage of high performance optical detection and laser noise cancellation Each chapter is full of useful lore from the author's years of experience building advanced instruments. For more background, an appendix lists 100 good books in all relevant areas, introductory as well as advanced. Building Eelectro-Optical Systems: Making It All Work, Second Edition is essential reading for researchers, students, and professionals who have systems to build.

New Scientist magazine was launched in 1956 "for all those men and women who are interested in scientific discovery, and in its industrial, commercial and social consequences". The brand's mission is no different today - for its consumers, New Scientist reports, explores and interprets the results of human endeavour set in the context of society and culture.

Optoelectronic devices operating in the mid-infrared wavelength range offer applications in a variety of areas from environmental gas monitoring around oil rigs to the detection of narcotics. They could also be used for free-space optical communications, thermal imaging applications and the development of "homeland security" measures. Mid-infrared Semiconductor Optoelectronics is an overview of the current status and technological development in this rapidly emerging area; the basic physics, some of the problems facing the design engineer and a comparison of possible solutions are laid out; the different lasers used as sources for mid-infrared technology are considered; recent work in detectors is reviewed; the last part of the book is concerned with applications. With a world-wide authorship of experts working in many mid-infrared-related fields this book will be an invaluable reference for researchers and graduate students drawn from physics, electronic and electrical engineering and materials science.
